17:        draw  $i \in \{1, \dots, N\}$  with probability  $\propto w_t^{[i]}$ 
18:        add  $x_t^{[i]}$  to  $\mathcal{X}_t$ 
19:      endwith
20:    endfor
21:    return  $\mathcal{X}_t$ 

```

**Table 8.3** An adaptive variant of MCL that adds random samples. The number of random samples is determined by comparing the short-term with the long-term likelihood of sensor measurements.

in lines 11 and 12. The algorithm requires that  $0 \leq \alpha_{\text{slow}} \ll \alpha_{\text{fast}}$ . The parameters  $\alpha_{\text{slow}}$ , and  $\alpha_{\text{fast}}$ , are decay rates for the exponential filters that estimate the long-term, and short-term, averages, respectively. The crux of this algorithm can be found in line 14: During the resampling process, a random sample is added with probability

$$(8.5) \quad \max\{0.0, 1.0 - w_{\text{fast}}/w_{\text{slow}}\}$$

Otherwise, resampling proceeds in the familiar way. The probability of adding a random sample takes into consideration the divergence between
